Abstract **B**

Objective: Examine the effects of a 6-month health multidimensional intervention on physical function, bone density, and mood in a diverse sample of community-dwelling older adults at risk for frailty and excess disability. **Method:** A quasi-experimental, pre- post-program design was implemented. Adults aged 55 years and older ($n = 337$, 60% African American) participated in the intervention and received assessments at baseline, 6 months, and 12 months. **Results:** Physical function was maintained during the intervention for both African American and White elders but declined at 12 months for both groups ($p < .0001$). Symptoms of depression improved during the intervention ($M = 0.65 \pm 0.07$, $M = 0.15 \pm 0.04$, $M = 0.68 \pm 0.07$, $p < .001$, respectively) but worsened at 12 months ($M = 0.68 \pm 0.07$, $p < .001$). Bone density scores remained stable from baseline (distal: -1.62 ± 1.17 , proximal: -2.73 ± 1.85) to 12 months (distal: -1.72 ± 1.21 , proximal: -3.11 ± 1.85 , $ps > .05$) for both groups. **Discussion:** Program findings may serve as a basis for the development of a randomized, controlled study to provide empirical evidence of intervention efficacy. Such findings may help inform the development of community-based programs to identify vulnerable older adults and provide vital preventative care to decrease frailty and excess disability.
